

Q3 Fairness

Throughout the test, the results show we cannot enforce the sufficiency and separation at the same time.

Case 1: Sufficiency hold but not Separation

Y = Hypertension

C = Hyperlipidemia

A = Gender

- Sufficient Check:

$$P(Y|C,A) = P(Y|C)$$

$$P(\text{Hypertension}=\text{Yes} \mid \text{Hyperlipidemia}=\text{Yes}, \text{Gender}=\text{Male}) = 0.5560581928250615$$

$$P(\text{Hypertension}=\text{Yes} \mid \text{Hyperlipidemia}=\text{Yes}) = 0.5560581928250615$$

so the sufficient is satisfied.

- Separation Check:

$$P(C|Y,A) = P(C|Y)$$

$$P(\text{Hyperlipidemia}=\text{Yes} \mid \text{Hypertension}=\text{Yes}, \text{Gender}=\text{Male}) = 0.5001088390530727$$

$$P(\text{Hyperlipidemia}=\text{Yes} \mid \text{Hypertension}=\text{Yes}) = 0.4639580370746129$$

so the separation is not satisfied.

Case 2: Separation holds but not Sufficient

Y = Hyperlipidemia

C = Vegetables

A = Gender

- Sufficient Check:

$$P(Y|C,A) = P(Y|C)$$

$$P(\text{Hyperlipidemia}=\text{Yes} \mid \text{Vegetables}='<400\text{g/d}', \text{Gender}=\text{Male}) = 0.6168907767803194$$

$$P(\text{Hyperlipidemia}=\text{Yes} \mid \text{Vegetables}='<400\text{g/d}') = 0.5821287241184987$$

so the sufficient not is satisfied.

- Separation Check:

$$P(C|Y,A) = P(C|Y)$$

$$P(\text{Vegetables}='<400\text{g/d}' \mid \text{Hyperlipidemia}=\text{Yes}, \text{Gender}=\text{Male}) = 0.5790000000000001$$

$$P(\text{Vegetables}='<400\text{g/d}' \mid \text{Hyperlipidemia}=\text{Yes}) = 0.5790000000000001$$

so the separation is satisfied.

In conclusion, we cannot enforce the sufficiency and separation at the same time
